Summer delivery for Amstrad

THE new Amstrad games computer will be formally announced next week.

The machine with 64K Ram, 32K Rom, a Z80 micro processor and a built-in cassette unit will be offered in two forms. A version including a separate black-and-white monitor will sell for £199. For £299 the price will include a monitor quality colour display (see *Popular Computing*

Weekly, March 15).

The machine features three text display modes — 20, 40 and 80 columns — and three graphics modes, 160 x 200 pixels, 320 x 200 pixels and 640 x 200 pixels. The colour resolution in the highest resolution mode is four colours per horizontal pixel screen line.

First deliveries of the machine to shops are expected in the summer.

Home copying beaten by dongle?

MICRODEAL has developed a software key or 'dongle' which it hopes will put an end to home copying of its cassette software.

The small hardware unit — about 1 inch square and 1/2 inch deep — plugs into the joystick port of the Dragon while a specially encrypted program is loaded. If the program is loaded without the software key connected to the joystick port, then the program will not run. Once the specially prepared program has been loaded with the key in place, it can be removed, the joystick connected, and the game played in the usual manner.

The idea is to give away the software key with each copy of the program sold. While the program can still be copied, the copies cannot be made to load without the key. Up to 2,000 different combinations are possible with the key, although all tapes of any particular program would be pro-

How to submit articles

Articles which are submitted for publication should not be more than 3,000 words long. The articles, and any accompanying programs, should be original. It is breaking the law of copyright to copy programs out of other magazines and submit them here — so please do not be tempted.

Accuracy

Popular Computing Weekly cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

Editorial

One of the commonest questions asked of computer magazines is 'Which computer should I buy?'

The question is simple and straightforward. The answer, unfortunately, is not.

Anyone thinking of buying a computer should first decide how much money they can afford to spend, and exactly what they want the computer to do. Setting a spending limit automatically helps to narrow down the choice — if you can spend up to £200, then machines such as the Spectrum and Commodore 64 should be considered, whereas if you can spend up to £400 then the BBC micro and QL should be added to the list.

Real problems start to arise for the first time buyer when deciding what the computer should do. In many cases, the purpose behind buying a computer is to find out what it can do. The first time buyer is seeking to enter a new field, not to engage in specific word processing or other micro related tasks.

The experienced user, with a particular function in mind, has no such problems. He just finds the machine which best matches his needs.

If you are a first time buyer, and don't know what you want a computer to do, the only solution is to take the plunge and buy one of the cheaper micros available. You can always upgrade later if you discover that you want to use your micro for more sophisticated tasks.

Next Thursday

Next week's star game is Pacman — which needs no explanation! — for Commodore 64 by S Buys.

Sinclair misses second deadline

SINCLAIR has failed to keep to its own revised delivery schedule for the first of its new QL microcomputers.

Following initial production delays in February, Sinclair announced that although it would be unable to keep to the 28-day dead-line for mail-order deliveries, it expected to despatch the first production run of machines — around 1,000 units — by the end of March.

With that deadline now passed, Sinclair's design difficul-

ties are still continuing and Sinclair at present still has no more than a handful of pre-production machines. Sinclair's managing director Nigel Clarke himself suggested one shipment deadline for the end of March. A spokesman for Sinclair admitted, "It is true that no QLs have yet been despatched, but we are confident of sticking to the target dates in the letters we sent to customers." — First of these is the end of April.

Sinclair has announced that it has appointed Prism as retail distributor of the machine. It is also working on an implementation of the Prolog lan-

guage for the machine.

● PCW's QL order: Week 11. Interest gained by Sinclair from our order is now over £5. The nature of the compensation to be offered by Sinclair is still shrouded in mystery.

Wrath of Magma delay

CARNELL Software's long awaited graphic adventure *The Wrath of Magma* has been delayed still further.

The three-part program is now not expected to be released until mid-April, some seven months later than originally expected.

Microdeal dangle

4 continued from page 1

tected with the same code.

Microdeal shortly plans to launch its first title protected by the dangle — *Buzzard Bait* for the Dragon 32. The program will cost more than other Microdeal games — £9.95 — because of the additional cost of manufacturing and including the protection device.

According to Microdeal managing director John Symes, the game was picked because it was the "best Dragon program we could find". *Buzzard Bait* is written by the US Tandy software house Tom Mix — which also produced *The King*.

The title will be released in the UK under the Tom Mix banner, through a new company — Tom Mix Software formed jointly by John Symes and Tom Mix.

"The development of the software key was undertaken for us by Northern Software Consultants and we are in the process of patenting our device.

"The key is encased in epoxy resin — even if people do discover what the custom chip inside does, it will take them six or seven off-the-shelf chips to emulate its behaviour, the cost of which are more than the cost of the original game.

"Our protection device is an experiment. If we don't sell more of *Buzzard Bait* than we usually do for a Dragon game then we will know it has been a failure.

"If it does sell well then we will produce versions of the key to protect Commodore 64 and Atari material."

Robotics resignation

JOHN Reekie has resigned as managing director of Colne Robotics to set up a new company, Reekie Research. The purpose of the new company is to develop a hobby robot.

The home robot will be of modular construction and the base unit — wheels, motor and basic platform — will sell for around £150. A rack system is then used to add up to 10 additional circuit boards to give the device a variety of extra features — an arm, infra-red control, ultrasonic detection, voice synthesis and voice recognition.

The complete unit with on-board system software and the capability to be controlled from a base micro using the infra-red communication link will be priced around £700.

The robot will be designed so that it will operate from any micro with either an RS232 or

Centronics interface.

The Reekie Research robot is scheduled to be launched in the autumn.

Micro shows round-up

BOTH the Sinclair Education Exhibition and the Electron and BBC Micro User Show were held last week.

The 29 exhibitors at the Sinclair show in Westminster Central Hall had to compete for attention with Sinclair Research's own stand, where its version of the Logo programming language was being laun-

Magic voice is launched

COMMODORE'S Magic Voice module has been launched at last.

The module fits into the Commodore 64 cartridge port, and is being launched in conjunction with two new series of software programs, which have been written to make use of it — *Talking Book* and *BJ the Bear*.

BJ the Bear features in the *Get Ready* suite of educational programs, designed for three to five year olds.

Get Ready to Read is now available — at £11.99 on cassette or disc — and *Get Ready to Think* and *Get Ready for Numbers* should be out in mid-April.

There are four learning levels on each program, and a menu of eight activities to each stage. The activities consist of question and answer games.

If the child gets the answer right, BJ's smiling head appears and confirms the correct answer. If not, his expression is distinctly grumpy.

A number of different phrases are generated by the software using the Magic Voice module, to express approval or disapproval such as "Yes", "That is not correct", and "You are right".

Each *Get Ready* package also contains a teacher's/parent's manual, and a story book about BJ for the child.

Magic Voice has a vocabulary of 187 words, the data for each letter of the alphabet and numbers. Commodore are planning to bring out a diskette with extra vocabulary in the near future.

ched, and where, on the first day of the show, a QL machine was on display. By the second day, however, the QL had mysteriously disappeared.

At the New Horticultural Hall 500 yards up the road, there were over 70 stands at the Electron BBC show. Among the companies, Pace Disk Systems launched *Fortress*, a Zaxxon style game at £8.95, and Alligata Software introduced *Spiffire Simulator*, following in the footsteps of Acornsoft's *Aviator*. Judging from the show, Electrons are still fairly thin on the ground.

The joystick that never was

THIS rather strange looking object is a revolutionary type of joystick developed by Sinclair.

Yet it will now never go into production. Market research

conducted by the company has shown that people prefer the more traditional type of device with a hand grip.

The prototype, developed by Sinclair's research and development team, is a cross between a conventional joystick and a cursor control 'mouse'. The hard plastic pad rests on a springy cushion. To operate it the rim is depressed — pushing down on the left-hand edge will send a 'left' instruction to the Spectrum and so on.

Sinclair's 'magic list'

Good news for all Spectrum owners who didn't buy their machines by mail-order from Sinclair.

Anybody can receive information on new Sinclair products or changes of availability by being added to Sinclair's 'magic list'. All they need to do is send their name and address on a postcard to Sinclair Research, Department M, Freeport, Camberley, Surrey GU15 3BR.

For example, I recently received from Sinclair the following communication: "Please be advised that the previous restrictions imposed on microdrive units and/or Interface I products have now been lifted. Therefore you can now order by letter or telephone any further items in this range."

Stephen Greiff
1 Chalfont Grove
Hastings Hill
Sunderland
Tyne and Wear

Is QL necessary?

One of your correspondents wrote recently asking for comments from users of the ZX Microdrive. I have just received my twin Microdrives and I have to confess that I am extremely impressed with their performance.

From the moment I switched them on they have functioned without error and every verification has proved successful.

Like many Spectrum owners, not only am I the proud owner of a Spectrum and Microdrives, I am also on the waiting list for the QL. I had planned on selling the Spectrum when the QL arrived but I am now seriously considering cancelling my QL order.

Why? In terms of hardware, there appears to be very little that the QL can do that the Spectrum can't. The QL of course has 128K of Ram but with Microdrives available, is this really necessary? The big

disadvantage of the QL is the lack of cassette interface.

One of the selling points of the QL is the software packages provided with the machine. However, the Spectrum has a fairly impressive list to draw on. Campbell's *Masterfile* is an excellent database and file-handling system. *Tasword* is an excellent wordprocessor. Spread sheet programs for the Spectrum abound but none of them come up to the promise of the QL package. However, *Microsphere* are promising up to 85 characters a line. This is already available on the Spectrum through Myrddon Software's *Microprint 85*. This is an excellent piece of code which gives the programmer virtually a free hand in terms of character width.

Long live the Spectrum. Will the QL ever leave the maternity unit!

Pot calling kettle black

It is now about six weeks since I sent off my coupons and cheque for your *Eye of the Star Warrior* tape offer.

Despite your 'allow 28 days for delivery' clause — just like the Sinclair ads — I have so far received nothing.

Yet you still, weekly, publish

details of the delay of your Sinclair QL. Isn't this the pot calling the kettle black, when you seem unable to meet mail-order delivery schedules yourselves?

Could I have some action please.

R A P Rudd
56 Cairngorm Crescent
Kincorth
Aberdeen

The bulk of the *Eye of the Star Warrior* tapes were dispatched within 28 days of receipt of order. However, a few people appear not to have received their tapes. If anyone has experienced any delays, please let us know.

No heroes

I am a 30-year old European from West Germany and my home is only 20km from the Mohnesee dam. I think your magazine is one of the best in Europe.

In the February 9 issue you published a review of a program *Dambusters* under the heading 'Heroic Stuff'. At last it is possible to bomb the Mohnesee every day — to kill hundreds of thousands of civilians. Is that a heroic act?

I am waiting for your answer.

Bodo Kirtz
Birmeckerweg 30
5778 Meschede-Wehrstepel
West Germany

Our review was intended as a satire — making very much the same observation as yourself.

Late arrivals

I would like you to publish this letter so that your readers know what kind of after-sales service they might get from Sinclair Research Ltd.

It started with the ZX80, which arrived six weeks later than it should have done. Then I bought a ZX81. And then a Spectrum 16K for which I had to wait a total of 20 weeks.

After 11 months of satisfied

custom the Spectrum went faulty on July 25th 1983. It took until the middle of January before I finally got a working Spectrum again after numerous letters and telephone calls to Sinclair. If that was not bad enough I have just recently put a claim in for P&P and they told me that it only costs £3.10 to send a Spectrum — yet they have the cheek to charge the customer £4.95.

The only consolation I got from Sinclair Research was that I could have any software cassette which costs less than £10 — which is nowhere near the cost of my telephone bills and the cost of postage. The average call to Sinclair Research is 15-20 minutes long and at 25p per minute that is £4.75-£5 every time I ring.

If this is the service they give to a regular customer then what kind of service are they going to give to a new customer?

Richard Bourne
10 Longfield View
Normanby
Middlesbrough
Cleveland

PS. I have also lost count of the number of times they have promised me a delivery date and failed to meet it.
PPS. Sir Clive is my hero.

Women and computers

I feel most strongly on the subject of women & computers, as I have been using computers for four years now, ever since the dark age of my Video Genie. I have since updated to a BBC and a Spectrum, which are constantly used until the early hours.

How it is reported that very few women use computers I'll never know, as one look at Micronet tells a completely different story. It is constantly used by many women and girls of all ages.

It would be a far better idea for Micronet or Prestel to organise their own voting poll to get a true idea. So what about it?

LEGEND

Pole Position

A new game for BBC Model B by Neil Barnes

Pole position is a graphical car racing game for the 32K BBC Model B with 1.2 OS, written in Mode 1. The object of the game is to travel for 200 miles without crashing into either the course or the skulls (which are randomly littered over the course). If you can collect any oil, then one mile is added to your score.

Procedures

- PROC def — gives instructions for the user.
- PROC instruct — gives instructions for the user.
- PROC go — checks for key depressions and increases the mileage.
- PROC check — decides if a skull has been hit or an oil can has been collected

- PROC car — prints the car on the screen.
- PROC course — prints the course and the various objects.
- PROC show — prints at the top of the screen the current score and mileage covered.
- PROC completed — called if 200 miles has been covered: produces a fanfare and gives a rating according to how many oil cans have been collected.
- PROC results — called if you crash before 200 miles — high score?
- PROC again — another go?
- PROC die — sounds a death siren.
- FN screen — rather complicated code — checks for collisions.

Variables usedFunction

- CX Horizontal position of car.
- R1 Miles covered.
- SC Number of oil cans collected.
- HS Highest score.
- A,B, Decide the printing position of the various obstacles.
- A% Used in conjunction with FN screen.
- E Used in conjunction with FN screen.
- ST Prints stars in PROC results.
- S,T,Q,W, Random number generators.
- DEL,G,J,N,P,U,V, General loop variables.
- ES End of game message.
- H\$ High score.
- A\$ Another go?

When entering the listing, all the spaces must be included — these are vital to the efficiency of the game.

And pigs will fly . . .

Graham Taylor talks to Matthew Smith and Alan Maton of Software Projects

Alan Maton is not merely the only man in Liverpool to wear white shoes, as a sideline he manages Software Projects — home of *Manic Miner* and *Jet Set Willy*. Between them, the two games have been responsible for more terror, anxiety, adrenalin, insanity and (probably) broken relationships than *Crossroads*.

Legends abound about the author of the *Miner* programs, many of them very silly indeed — what sort of mind could it be that conceived of the bouncing, beckoning fat ladies, clockwork penguins, moon faced, slightly famous, computer programmers and flying pigs as appropriate obstacles in a computer game. In fact, on close examination, Matthew Smith proves to be not only humanoid, but apparently, perfectly sane.

The story of how Alan Maton came to form Software Projects, with Matthew Smith as part owner and main programmer is, however, suitably odd. As most people know, *Manic Miner* was originally issued by Bug-Byte, a well respected software house also based in Liverpool. What may be less obvious was the fact that Software Projects was being set up by Matthew Smith and Alan Maton quite independently from Matthew Smith's work on *Manic Miner* — they never expected to issue it themselves.

"Everyone thought that we had always

collecting objects in a series of caves was mine, but I was thinking of something fairly straight — I had not expected Matthew to come up with cases populated with Penguins, Eugenies, kangaroos, and toilet seats. They aren't your standard aliens after all," he added, slightly ruefully.

To no-one's surprise, Bug-Byte accepted the program and within a month of release it was possibly the most highly regarded Spectrum arcade game ever. *Manic Miner* was successful for dozens of reasons, but two seem particularly important. Firstly, each screen was carefully designed so that there was only one or perhaps two ways of getting through — one false step and you got the boot. Secondly, it was very funny and proved that obstacles didn't have to look macho and threatening to raise the adrenalin (I shake at David Attenborough wildlife films featuring penguins . . . but maybe I always did). Finding genuine wit within a game was a revelation.

What, in retrospect, appears obvious may not have always seemed so when first released. *Manic Miner* was just one program in a batch of several — not especially segregated or differentiated from the rest. Indeed, for a long while it didn't even appear first in the adverts. Needless to say, Matthew was not pleased: "I really didn't

was a clause which said that should a game be withdrawn from the market upon written request, it would be returned to the programmer — I don't think anyone had expected that a programmer would withdraw his own game!"

Bug-Byte had sufficient reserves of the game to see them over the Christmas period and only recently have Software Projects' copies become the more widely circulated — the two games are the same, but for a few changed graphic shapes.

Technically, *Manic Miner* did several things supposedly impossible on the Spectrum — flicker-free sprites, no colour resolution problems and, in some ways most spectacular of all, continuous sound. I asked Matthew how these were achieved, but anyone hoping for amazing technical innovations will be (somewhat) disappointed.

"The answer to all those problems is simply care. Flicker-free sprites are perfectly possible on the Spectrum, if the coding is right. Equally, whilst you can't solve the colour resolution problem, you can ensure that colour conflicts do not occur simply by planning everything carefully."

Worth remembering next time you're looking at flickering, oddly coloured shapes in games. Although *Miner* showed that continuous sound was possible, few other software houses have risen to the challenge of providing it. "The sound is not difficult to do in terms of complex coding, but working out the tune takes ages — you simply interrupt the action very frequently"

Alan Maton (left) and Matthew Smith

planned to take *Miner* away from Bug-Byte, but it wasn't like that at all," explained Alan. "The idea of Software Projects had been kicking around for a while."

Alan worked at Bug-Byte, which capacity he met Matthew, whose first program *Slyx* had been accepted for marketing by the company. The original idea for *Manic Miner* was Alan's. "The name and the basic idea of a miner

feel any sensible attempt at marketing the program was taking place at all — the cover of the cassette was pretty awful too."

A few months after it had been released and was beginning to do really well, Software Projects was ready to be launched as a company. Matthew discovered that a clause in his contract with Bug-Byte enabled him to issue the game himself and take it away from them. "Basically, there

send a signal to generate a tone — the skill comes in making it sound like a recognisable tune. I use a little Casio to help me work out the notes."

What about the actual structure of the game? How does Matthew make each screen just possible to do (if *Willy* stands on his head whilst grabbing a rope and jumping twelve fat ladies)? "The answer is I spend ages and ages working it out — there's no easy solution, I wish there was!"

The only help Matthew does have in the development of his programs is a special macro language which is chiefly concerned with storing the character position of the aliens. "It means that each alien position can be stored in only two bytes, so it's very economical on memory."

From the moment the word on *Manic Miner* went around, people were eagerly anticipating its follow up. In the end, it was well over six months before it arrived. Alan agrees it was late. "Matthew kept saying to me, 'It'll be finished by Monday' — a lot of Mondays came and went. Quite simply, the program grew and grew, Matthew kept adding more and more rooms until, at about 50, I decided we had to stop."

The arrival of *Jet Set Willy* saw major distributors acting with a lack of their usual decorum — after all, sales of the program were absolutely guaranteed, provided no other shop beat you to it.

Alan remembers the night well when the first copies arrived. "It was a bit like the first bottle of Beaujolais. Everyone went mad trying to rush them into the shops. We had people turning up at our offices all through the night — one guy flew up from London by plane, rushed in with his docket, collected his copies and flew back on the same plane which he had waiting for him." Most people who rushed in to buy several hundred

copies were back within the week for more.

Matthew's computer expertise began with a Tandy he had had since 1979. "I taught myself machine code programming using it and now I use a TRS 80 as a development system hooked up to the Spectrum."

He is doubtful about the Spectrum's future. "I really think we've reached just about the end of what's possible on the machine. We have sprites on a machine that doesn't come with any, some attempt at continuous sound when the hardware doesn't allow for it, 16 colours when there are only supposed to be eight, and games nobody would have dreamed you could have fitted into 48K — that's the limit I think."

Matthew sees the games he produces as adventures, which use only three simple commands. "The twists and skills required for *Jet Set* have much more in common with adventures than arcade games and if you get reasonably competent, an average game could last an hour or more — it's just that there's nothing to type in."

"It's an area I plan to explore more, but not on the Spectrum."

Matthew and Alan are waiting for a clear contender to emerge to replace the Spectrum. "I'm uncertain about the QL. People rave about it, but the 68008 chip is not so far different from the 6809 which is in the

Dragon. It might not be good enough, but obviously I'm waiting to see a machine close up — I like the look of the MSX machines and perhaps the new Amstrad."

As to future plans for Software Projects, the most welcome news must be that, like all the best epics, the *Willy* saga is to be a trilogy. Matthew is understandably reluctant to put a date on part three, but it won't be soon.

What can be revealed is that it will almost certainly be called *Willy and the Tax Man* and will involve Willy trying to find his way through a maze of inland revenue offices in order to pay his income tax (probably capital gains too, given all that gold he found). However, Matthew promises a series of three games before Christmas. "They'll be basically space games, although with some special features," he added mysteriously.

From Alan's point of view, Software Projects is at an important point. "We need to build up a large range of respected and popular titles. We can't just rely on Matthew — we are developing an in-house programming team, with Matthew acting as sort of overall supervisor and technical advisor. Anything that's good, we'll issue. I don't want us to become just the 'manic miner software house.'"

Write your own machine code adventures

Without any knowledge of machine code whatsoever

STOP PRESS!
Available soon for
the Commodore 64

THE QUILL

THE QUILL is a major new utility written in machine code which allows even the novice programmer to produce high-speed machine code adventures of superior quality to many available at the moment without any knowledge of machine code whatsoever.

Using a menu selection system you may create well over 200 locations, describe them and connect routes between them. You may then fill them with objects and problems of your choice. Having tested your adventure you may alter and experiment with any section with the greatest of ease. A part formed adventure may be saved to tape for later completion. When you have done so **THE QUILL** will allow you to produce a copy of your adventure which will run independently of the main **QUILL** editor, so that you may give copies away to your friends.

THE QUILL is provided with a detailed tutorial manual which covers every aspect of its use in writing adventures.

NEW FROM THE GAME LORDS!

SIX GREAT NEW GAMES FROM QUICKSILVA...

COMMODORE 64 STING 64 £7.95

Author: **Anton Hinxman**
Hive-cave action!
Bertie Bee needs help
defending the hive. Fight off
the invading swarms, battle
the bees and defend your
Queen!

COMMODORE 64 BUGABOO (THE FLEA) £7.95

Author: **Indescomp**
Itchy action!
Jump your way out of the
caves with Bugaboo the flea
but beware of the fearsome
Dragon as you jump around
the exotic vegetation.

48K SPECTRUM RAYMOND BRIGGS' THE SNOWMAN £6.95

Author: **David Shea**
An enchanting game based
around episodes of Raymond
Briggs' amazingly successful
book.

48K SPECTRUM ANT ATTACK £6.95

Author: **Sandy White**
Battle the Ants in the soft
solid 3D city of Anteschner.

48K SPECTRUM DRAGONS BANE £6.95

Authors: **M. Preston,
P. Hunt, R. Rose,
D. Moore.**

A mythical graphic
adventure in the dark and
deadly halls of Earthstone
Castle. Battle Dragons,
Vampires, Sphinx, Zombies,
Skeletons, Gryphons and
other legendary beasts to
rescue the beautiful Princess
Paula.

48K SPECTRUM FRED £6.95

Author: **Indescomp**
Action beneath the
Pyramids!
Fearless Fred the Intrepid
Archaeologist searches the
creepy catacombs below the
torrid tomb of
'Tootiecaroon' for the
terrible treasures amidst
monstrous mummies,
ghastly ghosts, bats
and rats!

The bard bytes back

Christina Erskine suffers slings and arrows as she annotates her way through the new educational programs from Penguin

Games programs have long had everything their own way in the home computer market. While educational software has been largely aimed at primary schoolchildren, there has been a marked lack of material for those at a more advanced level.

A number of companies have spotted this gap in the market, and are beginning to bring out educational programs aimed at the older student.

One somewhat unlikely party, on the face of it, is Penguin Books, who has just produced a series of six English Literature titles in program form, designed specifically for students of CSE or 'O' Level standard.

Predictably enough, they have started with Shakespeare. The titles are those plays most commonly studied at this level: *Romeo and Juliet*, *Macbeth*, *Henry IV Part I*, *The Merchant of Venice*, *Twelfth Night* and *Julius Caesar*.

The programs are intended for the student revising at home — initially, they will be available for Spectrum 48K with BBC and Electron versions out in May, and for Commodore 64 in August.

Shakespeare may be spinning in his grave at the thought of being neatly packaged for the micro, but Penguin are extremely enthusiastic about the project. They have gone as far as to term it 'the first truly revolutionary breakthrough in the study of literature since the invention of printing'. Rather more realistically, they have also claimed it is 'possibly the best piece of educational software coming out in 1984'.

Each program starts with a menu of three items: people, themes and Acts. Select 'people' and you get a list of the important characters of the play. Select 'Themes' and a list of the dominant themes appears. You can choose whether to study one character or one theme throughout the play, or in conjunction with one or two other characters or themes, or in a specific Act or Acts.

Having made a choice, the program then searches through passages relevant to the inquiry. It is here, in the treatment of material, that the program becomes quite distinct from other educational software packages.

There are no gimmicks, such as fancy graphics, to illustrate the information, and no neatly presented questions and answers.

An exact line reference (from the Penguin Books edition, naturally) is given for each relevant point, and a short line comment appears on the display. The comments range from explaining the line reference given, to, more frequently, asking you to consider the significance yourself. In other words, it is not too dissimilar from a discussion session in the classroom. It soon becomes apparent that it is impossible to use the programs to any effect without a copy of the text open in front of you.

The authors of the programs, John Mahoney and Stewart Martin, are keen to emphasise this point — the software is a supplement to the text, and in no way a substitute.

John and Stewart spent about two years compiling the programs. Both English teachers at Kent, they also had considerable computing experience behind them.

They felt that much of the then available educational software was inadequate, and that the technique of using 'mindless guessing games' — to quote John — gave very little concrete help to students. They found, also, when presenting courses for teachers interested in software that many teachers were daunted by the difficulty of running some programs.

John and Stewart soon came to the conclusion that in order to see the sort of software on the market that they wanted, they were going to have to write it themselves.

They decided that using a menu to select the topics for study would make the programs simple to operate, and compiled and

wrote out the display notes from there. This stage took them two years.

They then rang various publishers, and contacted Penguin Books just as Penguin had decided it would move into the software market. They were signed up almost immediately.

Indeed, Penguin was so keen that a third person, Randle Hurley, an acquaintance of the authors, was drafted in to help transfer part of the programs into machine code in time to meet Penguin's deadline.

Both John and Stewart have now resigned from their teaching posts and are setting up their own educational software. They will be producing programs for 20 more literature texts for Penguin, and then they will contract out work in five other subject areas: Maths, Physics, Chemistry, Biology and Geography, also for Penguin.

The titles of the 20 other texts have not yet been finalised, but they will be moving away from Shakespeare, and will include novels, and will almost certainly be standard 'O' Level set works. Whether D H Lawrence, for instance, lends himself to the same menu pattern as used for the first six remains to be seen, and both John and Stewart admit that the operation of the programs may have to be modified somewhat when dealing with novels.

Looking at the Shakespeare programs, the menu selection does seem to suit the nature of studying the plays at this level. Most 'O' Level exam questions ask the candidate either for a character study, or a theme study, or a conjunction of the two, and here the programs follow closely the type of revision a candidate is likely to undertake.

The authors have tried, however, to make constant reference to other parts of the play, and other characters and themes on the displays. Nevertheless, you are still

left with the impression that each character and theme can be neatly lifted from the play and studied as a quite separate entity.

This regrettable aspect of 'O' Level teaching is aggravated, I think, by the fact that there is no print-out facility on the programs. If you could research your chosen topic on the micro and then have a print-out, along with all the cross-references given along the way, it would help to show not only the topic as a whole, but also all the links to the rest of the play.

For example, a favourite 'O' Level question is one that links Holmshurst in *Henry IV Part I* with the theme of Honour. Honour is generally considered to be one of the major

themes of the play, and certainly the program throws up several references if you select Hotspur + Honour to research. Equally interesting, however, is the number of cross-references made, especially if you look at Honour without requesting Hotspur as well. You are asked to consider every character in the play, and referred to over half the other themes during the course of

two people, the selected references are naturally eclectic, and as the authors have many years experience of teaching English Literature to this standard, the information and comments conform wholly to 'O' Level teaching content. You do, however, have to beware of over-estimating the programs' thoroughness. While it is tempting to 'play' with the menu in the hope of unearthing fascinating links within the play, the serious student is best advised to look at the topics as widely as possible.

Suppose you wished to investigate the romantic element in *The Merchant of Venice* — a fairly strong theme.

It is unwise to be specific here. Select Portia + Bassanio + Romance, and you will receive just one reference. Try Portia + Romance and the program yields three references. Neither gives you very much to go on.

Look for details of the subplot romance and you will receive even less. For Jessica + Lorenzo + Romance, there are no references at all, except the screen that appears each time there are no references, telling you that you are searching for a combination that will not help your understanding of the play.

In this case it is obviously not quite true, and in fact the way to get the most out of this subject is to look at Romance on its own — you will find plenty of references and also discover that Romance in *The Merchant of*

the search. If you looked at the search for Honour as a whole on a print-out it would become immediately apparent that Honour is a major theme because it holds many of the play's strands together, and not just for its own sake.

The authors plead lack of time and their desire for simplicity as the reason for not including a print-out facility; it would be nice to see it planned for future titles.

Their avowed intention to make you discover things for yourself, rather than handing all information over on the screen, is undoubtedly admirable, though occasionally frustrating.

Frequently the display passage for a particular line reference simply says, 'What does this remind you of?' or 'Where else in the play is this mentioned?' Fair enough, but if you can't find the answer, the program isn't immediately useful.

Occasionally, I think they take this approach too far.

If you select Witches + Darkness to investigate on *Macbeth*, you will come across a display relating to Act 2, Scene 3, Line 68, which reads, 'Look up the word "gorgon" in a good dictionary — what echo do you hear — notice how throughout the play it is always present.'

You are already armed with a battery of equipment: a computer, a Penguin Study Software cassette and a copy of the text. Now you have to go and get the dictionary as well — and how do you know if it is 'good' enough? It would not have overstrained 48K of memory to have inserted the required definition of 'gorgon' in the program.

As the programs are entirely the work of

have to go back to the beginning and start again.

In general, the programs contain very little that would not come up in the course of a two year 'O' Level syllabus.

Because of this, I feel that they are not so much a study aid as a revision aid. Someone with no knowledge of the plays would not gain much understanding of Shakespeare's work by sitting down with one of the programs, as they are written with a very narrow usership in mind — The CSE 'O' Level student with exams fast approaching. Some students may well be disappointed by the unrelievedly serious approach of the programs.

The content of the searches themselves will not so much teach you something new about the plays as remind you of notes you should have already — but it is quite possible that it will suggest a different way of looking at some aspects.

There is no reason either, why the 'A' Level student shouldn't find the programs useful, though necessarily on a more superficial level. The authors say that they have heard from older students (using pre-production tapes at the schools where the authors taught) who had gained much from using them.

Certainly, Penguin's Literature software will be a hard act to follow. The programs have managed to balance reasonably sophisticated information with simplicity in presentation.

The tabulation of information according to line reference makes the comments very clear, although it would be dangerous if the user gained the impression that only the parts of the play quoted in the Penguin Study Software Packages were relevant.

But I feel the attempt to present the software as genuinely educationally useful has been largely successful, and I shall be very interested to see *Lord of the Flies*, *To Kill a Mockingbird* and the rest of the GCE Greatest Hits when they appear.

Venice is related to far more than just the characters themselves.

One slightly annoying aspect of this is that it means you may have to go through a lot of material to find one particular reference you are looking for. And although you can break off a search at any time by pressing *Edit* (on the Spectrum), there is no scroll-back facility if you wish to refer back to something in the search. You will just

Tuned in

Roy Masfield presents a program for radio-frequency tuned circuits

Were it not for the convenient behaviour of inductors, capacitors and resistors in so-called tuned circuits, radio communication and TV, as we know them, would be impossible.

An inductor, which is really nothing more than a coil of wire, has the property of storing energy in the form of a magnetic field; a capacitor, which is two large surfaces separated by an insulator, stores energy in the form of an electric field. When an inductor (L) and capacitor (C) are connected together as in Figure 1(a) and a current is started in the circuit, then the energy oscillates between the two components.

The rate of oscillation, or frequency (f), depends only on the numerical values of L and C. If L is in Henries (the unit of inductance) and C is in Farads (the unit of capacitance), then the frequency is given by:

$$f_0 = \frac{1}{2\pi\sqrt{LC}}$$

This particular frequency, f_0 , is known as the resonant frequency of the combination. In radio applications, it is more usual to express L in micro-Henries (μH) and C in pico-Farads (pF), and in the formulae given hereafter these units are assumed. Of course, in any practical circuit there will be some resistance (Rohms), chiefly associated with the wire of the coil, and energy will be dissipated in this, so the current would soon die away as indicated in Figure 1(b).

However, if we connect an alternating current (a.c.) generator in the circuit as in Figure 2, then, if the frequency of the generator is the same as the resonant frequency of the circuit, the oscillations can be kept going strongly with very little input from the generator — in fact, only just enough to make up for the loss in R. It is analogous to the way that the pendulum of a clock can be kept swinging by quiet small pushes from the escapement at just the right frequency.

The whole point, though, of these tuned circuits is that at resonance the voltage across either L or C in the series circuit can be much greater than the applied voltage, while in the parallel case the current through these components is greater than that from the generator.

We are not getting something for nothing because these voltages and currents are in anti-phase and cancelling, so we can't draw more power from the circuit than we put in. Nevertheless, the voltage across, say, the capacitor, can be applied to an amplifier and in that way we can get our power gain.

At frequencies other than resonant, the

voltage or current is less than that at resonance, so this gives us a way of 'tuning' to any desired frequency. If we replace our generator by an aerial which is picking up many signals over a wide range of transmitted frequencies, we can select the one we want by a suitable combination of L and C. Figure 3 shows a general way how the voltage across the capacitor in a series circuit depends on the applied frequency.

Well, how is a computer going to help? We want to plot a response curve like Figure 3, we have to know the impedance (Z) of the circuit at any frequency. (Impedance is the 'resistance' of the circuit to a.c. and is measured in Ohms.) It is a simple matter to find Z at f_0 because the reactance of the inductor (X_L) is equal but of opposite kind to that of the capacitor (X_C), and so they cancel. Reactance is the 'resistance' of L or C at a.c. and is given by the formulae:

$$X_L = 2\pi fL \times 10^{-6} \text{ and } X_C = \frac{1}{2\pi fC \times 10^{-12}}$$

The overall impedance in a series circuit is just R at resonance, and is greater at all other frequencies, while, for a parallel circuit the impedance is $1/CR$ at resonance and less at other frequencies. In a short article like this, it would be impossible to derive these results, but they can be found in any good radio text-book.

When we come to impedance of resonance, the formulae become rather formidable:

For the series case:

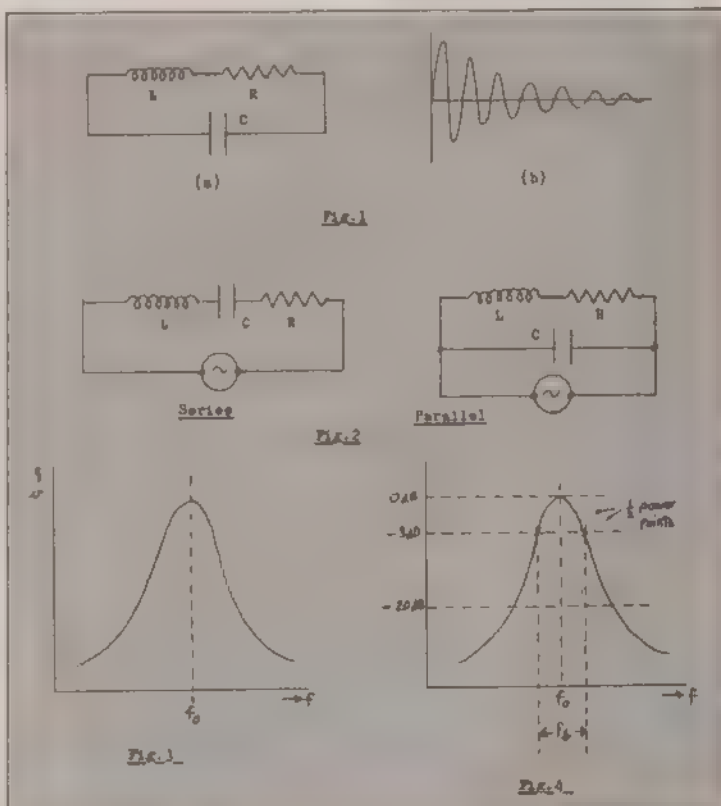

$$Z = \left[R^2 + \left(2\pi fL \times 10^{-6} - \frac{1}{2\pi fC \times 10^{-12}} \right)^2 \right]^{1/2}$$

For the parallel:

$$Z = \left[\frac{R^2 + 4\pi^2 f^2 L^2 \times 10^{-12}}{(1 - 4\pi^2 f^2 L C \times 10^{-18})^2 + 4\pi^2 f^2 C^2 R^2 \times 10^{-24}} \right]^{1/2}$$

To plot the response curve means working out these impedances and converting to decibels (dB's) for a fair number of frequencies on each side of resonance, and this is indeed laborious. Hence the computer program.

While we are at it, other useful properties of tuned circuits can be evaluated. One of these is the Q-factor, sometimes called the 'magnification' of the circuit. It is the ratio of

Programming

the reactance of the coil at f_0 to its resistance, $Q = X_L/R$ and it has no units, it's just a number. It is a kind of measure of the 'goodness' of the coil and helps to show if a circuit is going to be good at separating one signal from another. High values of Q are associated with low values of R , and the response curves peak sharply.

The other useful property to know is the bandwidth (f_b); this is the range of frequencies over which the response is greater than $1/\sqrt{2}$ of its peak value. On the curve the points where this occurs are called the minus 3 dB or half-power points as shown

In Figure 4,

Now to the program. When it is Run, the display will be as in Figure 5, and you must enter values for L, C, r and t_b . Where any of these is unknown, enter a ?. If too many question marks are entered you will be told there is insufficient data for calculation of all the answers. Thus, if R is not known, it will be impossible to find Q and t_b , while for L, C, and t_b , any two must be known if the third is to be found.

After the data is in, calculation proceeds and the display will be as in Figure 6. It is then possible to go on to the frequency

response as directed, assuming R is known or is not zero; there is a choice of series or parallel configuration. In either case the values of Z can be calculated for specific frequencies, or a response curve can be drawn for a range of frequencies 30kHz on each side of f_0 as in Figure 7.

Apart from giving specific answers, this program will also demonstrate the effect of resistance on the response. For the same values of L , C and I_0 , curves can be drawn with different values of R and so direct comparisons made. A printer is useful to give a record of each curve.

Character references

Mark Lawrence explains how to print 64 characters per line in the first of a new series on machine code

This is a utility routine which can be incorporated in your own program, allowing printing of 64 characters to each of the 24 lines, so that much information can be displayed on the screen.

The complete routine, including 768 bytes of data for the smaller character set, occupies just 1000 bytes and you should find it simple to use. Whenever you want to print in this way, simply add two lines like this:

```
10 RANDOMIZE USR 31600
20 REM AT 10,10 — "message"
```

The — represents a space and REM and AT are the Basic keywords. It is important to follow this format and make sure that the information to be printed is on the line following the USR call as the routine uses the system variable Nxtlin, which holds the address of the next line in a basic program.

Type in the hex loader and enter 31600 to the prompt for a start address. Now enter the code and Save "64print" Code 31600,1000 then verify it. Now enter an example such as:

```
10 RANDOMIZE USR 31600
20 REM AT 10,10 — "This is a great program"
```

Now run it. If all well the message should be printed. If it is not printed, enter the check program and check the code against the listing. Poking any incorrect entries

LIST

```
10 LET a$="0123456789ABCDEF"

RAINBOW'S SPECTRUM PROGRAMMABLE JOYSTICK INTERFACE WITH SOUND NOW IMPROVED

- * The keyboard is NOT disabled when using the Joystick.
- * You can have a Through Port - See Below.

As before, its features are:

- PROGRAMMABLE** — Allows any joystick position to represent any key on the Board without wires or leads or tapes
- UNIVERSAL** — Enables use of ALL Software
- AMPLIFIED SOUND** — Internal micro-chip amplifier boosts Spectrum's beep with simple connection to ear or m.c. socket
- EASY TO USE** — All joystick positions are programmed simply by selecting joystick position, pushing desired key on spectrum, releasing joystick, and then the key
- ADAPTABLE** — Accepts diagonal positions

ONLY £24
Extra for
Through Port £3
plus £1 p&p.

This is a top quality product with guarantee

METAGALACTIC LLAMAS BATTLE AT THE EDGE OF TIME

Just as the great war for the possession of the planet Earth is drawing to a close, the great war for the possession of the planet Llama is drawing to a close. The great war for the possession of the planet Llama is drawing to a close. The great war for the possession of the planet Llama is drawing to a close.

THE LAMAS

The Llamas are a race of intelligent, friendly creatures who live in the mountains of the Andes. They are known for their ability to produce wool, which is used to make clothing and other items. They are also known for their ability to produce llama meat, which is a delicacy in many parts of the world.

ATTACK of the MUTANT CAMELS

Planet Earth and Planet Llama have both been attacked by a race of mutant camels. These camels are known for their ability to produce a substance called "camel wool", which is used to make clothing and other items. They are also known for their ability to produce camel meat, which is a delicacy in many parts of the world.

Stonechip's Programmable Joystick Interface.

You can also listen to them
with Stonechip's Echo Amplifier.

Programmable Joystick Interface. This also enables any Spectrum software to be used with a joystick, irrespective of which keyboard keys have been chosen for function.

Programming is easy using only a single switch. Switch one way to program and another way to play. No tapes to load or links to worry about - programming is achieved by hardware. Used with Atari-compatible joysticks. Simply plugs into rear expansion port of ZX Spectrum. No other connections to make, no additional power supply required.

Echo Amplifier. How would you like to listen to the sound output from your ZX Spectrum without ear strain? The Stonechip Echo amplifier can do this for you as well as easing the tedium of saving or loading of tapes and enlarging the range of tape recorder compatibility with the computer. The amplifier has volume control over a range adequate for most uses, and a tone control for harsh or mellow sounds. A switched interface removes the need to swap leads during 'SAVE'ing or 'LOAD'ing. Leads are left connected all the time and the desired function is selected on the three position switch by the user. Use the 'CUE' facility enables an audio cue to precede the program being 'SAVE'd' on tape, a decided advantage when searching through multi-program tape. The Echo simply plugs into the Ear, Mic and Power sockets the computer and does not require an additional power supply. The expansion port at the rear the computer is left free for use with other peripherals and the unit is housed in an attractive case custom designed to complement the ZX Spectrum.

Take the plunge

Jason Orbaum and Geoffrey Campbell discuss Assembly language programming in the first of a series of six articles

Many people have now owned their Dragon for more than a year and have got past the stage of timidly approaching the keyboard to attempt Basic programs such as "Guess the number the computer is thinking of", or "Maths quiz". Those who wish to write faster, more 'powerful' programs have three choices: They can buy a compiler which will turn a subset of the Basic into machine code, they can purchase another language, such as Forth or Pascal and learn that, or they can go to the heart of the Dragon and take the plunge into assembler (machine code).

There are no end of books coming onto the market on the subject of machine code, but hardly any of these books offer examples of coding in the form of Britain's most popular computer activity — games.

This series of articles hopes to change that. Armed with these, and a good assembler (about which more later) the beginner should find himself writing good programs in no time at all.

The chip that controls the Dragon is the 6809E from Motorola. It is one of the most powerful chips of its sort (eight-bit) on the market and is an excellent chip to learn on.

The way the user communicates with this chip and feeds it instructions is via an interpreter. One example of this is the Basic interpreter, supplied with the computer, through which most people enter their programs. The interpreter takes each line, analyses it, and executes the machine code routine in the Rom that is needed for that command.

Another 'interpreter' is the assembler, without which Dragon machine code programming becomes almost impossible. The assembler translates the mnemonics (instructions typed in by the user) into the numbers which the machine understands.

The assembler used in all of these articles is *Dream*, the assembler marketed by Dragon Data. This assembler (the cassette based version) is quite suitable for the beginner, being easy to use and one of the cheapest, widely available assemblers on the market.

Now we will move on to the inside of the Dragon, and a memory map. This shows the internal arrangement of the Dragon, with an explanation of what each area of memory is used for.

The direct page Ram (0-255) is used for storing addresses, to which the computer jumps, in a similar way to the Basic Goto.

Memory Map for use with Part 1

Hex Address	Contents	Decimal address
(Base sixteen)		(Base ten)
0-FF	Direct page RAM	0-255
100-3FF	Extended page RAM	256-1023
400-5FF	Text Screen	1024-1535
Graphic Screens		
600-BFF	Page one	1536-3071
C00-11FF	Page two	3072-4607
1200-17FF	Page three	4608-6143
1800-1DFF	Page four	6144-7679
1E00-23FF	Page five	7680-9215
2400-29FF	Page six	9216-10751
2A00-2FFF	Page seven	10752-12287
3000-35FF	Page eight	12288-13823
1E00-7FFF	Program and variable storage	7680-32767
8000-BFFF	Basic interpreter	32768-49151
C000-EFFF	Cartridge memory	49152-65279
FF00-FFFF	I/O (Input/Output)	65280-65375
FF60-FFDF	SAM control Bits	65376-65503
FFE0-FFFF	MPU vectors	65504-65535

The text screen area (1024-1535) is used to store the characters that make up the screen. Many people access this directly from Basic using *Peek* and *Poke*. Locations 1536-13823 are used in the same way as the text screen area, but they

Geoffrey Campbell (left) and Jason Orbaum

store the data on the hi-resolution screens. No doubt someone has noticed, that according to this memory map, the program and variable are stored on graphics pages 5-8. This is not a typing error, but is due to the number of graphics pages that are initially reserved for use from Basic (via the *Pclear* command). This does not matter for machine code programs, as there will be no Basic program to overwrite. If *Pclear* is entered from Basic, then program and variables all move up to 13823, on top of all eight graphics pages. Listings one and two are two Basic programs to demonstrate some of these. See if you can understand how they work, and we will convert them to assembler at a later date.

After this, we have the Basic Interpreter, which is stored in Rom; the contents of which cannot be altered by the user. It may seem, therefore, that this area is of no use to the machine-code programmer. This is not so, however, as there are quite a few useful Rom routines, as will be shown in a subsequent article.

Next we have the cartridge memory. This is similar to the Basic interpreter, but, as the cartridge has to be present to access the Rom in it, we can safely ignore it.

The last three sections, Input/Output, Sam control bits, and MPU vectors, are mainly for system use. They can be used by the programmer, but are not needed except for advanced programs.

In the next article, we will be taking a close look at the hardware behind all this, and explaining listings one and two.

Whistle while you work

John Meech presents a program to help children learning to play the recorder

This program is designed to help children who are just learning the recorder to become familiar with the notes. No attempt is made to teach music and the notes are given in the form of letters with the uncovered accompanying holes displayed.

Three tunes are contained within the program — *Whistle while you work*, *When the saints go marching in* and *Clementine*. They contain increasingly difficult notes with which the child must try to become familiar. Along with a selectable tempo, this provides a useful system for children to practice using the computer as a teacher.

The program recognises 11 notes, as children who progress beyond these should be proficient enough to teach themselves. You may add tunes of your own using the notes specified. The format is [Note, Duration] where the note is given by a letter from A to G, followed by an L if the note is a low one or a # (shift 3) if the note is a sharp. For the appropriate duration see page 181 of The User Guide.

The tunes are stored in Data statements in lines 1330 to 1350. The first Data item is the length of the tune in notes, and the names of the tunes are stored at line 1310.

Notes

- 10-170 Dimension arrays, print title, draw border and draw Recorder
- 180-240 Call procedures to run main program
- 260-420 Draw the Recorder's holes. Each hole is a different colour from 7 to 15. This enables each hole to be 'opened' using the VDU15 command
- 440-580 Disable escape key, remove cursor, define text window and characters for holes. Read Note values.
- 600-890 Select tune and speed, Play tune and display appropriate notes
- 910-960 Calculate note value to play.
- 980-1020 Calculate duration of note and play note with appropriate fingering
- 1040-1100 Uncover appropriate fingerholes. This is done by setting the actual colour of the holes used to be white
- 1120-1160 Set all holes to be 'open again'
- 1180-1350 Data for Recorder, Notes and Tunes.

Trashman

New Generation products are sold according to their terms of trade and conditions of sale.

**It's the fun game of
the year – Trashman.**

From the moment you sit
down to play you'll be thrilled by
this exciting, original, laugh a
minute game.

Your job may look easy to the rest
of the world, but you know the hazards –
speeding cars and pavement cyclists can
both shake you up. Let's face it cars can
be fatal.

But if that isn't enough you've got the
other problems of vicious dogs, the after
effects of overeating in the transport cafe or one
too many in the boozier.

Not only will you be gripped by the action
you'll be amazed and amused by the high quality
graphics.

With seven levels of play featuring three
attempts to finish the game (assuming you are not
run over by a car) Trashman will provide even the
most experienced games player with a thrilling
challenge. 1 or 2 player option, Hall of Fame and
joystick compatibility* ensure this game has all the
best arcade features.

Trashman is available **NOW** for the 48K
Spectrum. Ask for it today at your local
computer store!

Only £5.95

*Kempston, Sinclair Interface 2, Protek or equivalent

BEYOND

CHALLENGING SOFTWARE

Less than human, far more than mere computer

The Psytron controls the massive Betula 5 Installation. When the attack comes, it will cope with defensive demands which would leave a human brain unhinged, computer circuits scrambled. Damage in any sector of the base must be assessed and its effect on the fabric of the installation calculated immediately. Human lives will be expended as necessary but if the Psytron ever goes down...

The Sinclair Spectrum has always attracted the best programmers. It's always had the most innovative software: Psion Scrabble, The Hobbit, Jet Pac and now...

PSYTRON

Ten screens of stunning graphics, animation which makes other programmers gasp, a 20 page booklet of hints, tips and help with the discovery of each of six levels of play.

"How long can you survive the Final Conflict? A true Psytron would last an hour and a Sinclair Q.I. goes to the first person to match that feat."

DECEMBER 2007

Sequence of events

Pete Gerrard looks at sequential access on the disc drive

As anyone who has bought a disc drive for the Commodore 64 will know, the manual supplied with it is not a model of clarity.

Over the next few weeks we'll be taking a look at just some of the things that the 1541 disc drive can do.

The first and most important thing to remember is that the Commodore disc drive is 'intelligent'. This may seem a remarkable statement to someone who's attempted to use this drive and then got hopelessly muddled up! However, its intelligence comes, not from being able to think for itself, but from the fact that information can be stored in the disc drive just as it can be stored in the computer. There is a 2K buffer that can be used to temporarily store information and to read information back from later, and we'll be using this next week to start constructing a random access file.

To start the ball rolling, let's take a look at sequential files.

Sequential files

As the following listing shows (see fig 1), writing a sequential file is not too different on disc from the format used for tape. Simply open the file (Line 10) using a File Number (2), a Device Number (8) and a Channel Number to send information down (2). Give it a name (Fred), and inform the computer that this is a sequential file and we're ready to write some data.

Lines 20 and 30 are then just a loop to write the data onto disc, using the `CHR$(13)`

the screen just to prove that it has actually been read properly (Lines 70 to 80). Line 90 then closes the file again and, to finish off, Line 100 informs the user that the data has been read.

In the listing, Lines 15 and 35 are nothing to do with writing files, but instead keep track of how long it takes the computer to print the information onto the disc. Under normal circumstances, this is about 1.8 seconds (your result may be either slightly faster or slower — disc drives vary quite a bit).

This timing test can be used to show that it is possible to speed up the rate at which the computer is capable of sending data to or reading data from a disc.

By blanking the screen during the reading or writing process everything can be made to happen approximately 10% quicker. This is not very noticeable on a short program such as this (times become typically about 1.6 to 1.65 seconds), but on longer programs a 10% saving can be quite handy.

To blank the screen, don't just clear it. Enter a Line `POKE 53265,11 <Return>`, and a Line `POKE 53265,27 <Return>`. This turns the screen off, lets the computer do the work, then turns it on again so that you can see the improved result. Why should this speed everything up? Because the computer now only has to worry about writing data, rather than having to continually refresh the screen display as well.

As a simple example of the sort of things

graphical characters, although you could extend the program to include them if necessary) to be found in a Basic program, whether it be Basic 2 as used by the 64, or any different form of Basic used by any other Commodore machine.

This data is read into an array `AS` in Line 10 and if you can't get the program to work, then you've probably missed out one of the items of data somewhere.

Line 15 then asks you to type in a program name, which is used in Line 20 to open a file for reading a program. Line 18 opens a channel to allow the error message to be read — in case of disaster, a mis-spelt filename, or some other error. Lines 500 and 502 do this job.

Character conversion

Programs are stored on disc as program files. That is, a sequential list of characters in ASCII format, with the line numbers and a line 'pointer' to show whether there is another line of program or not.

Thus, by knowing what to read and where to read it from, it is possible to convert that data into characters and print them on the screen (or the printer, by changing the `Print` statements to `Print#` statements, and opening a channel to the printer).

Line 25 sets a screen line pointer to be equal to 0, and `Get`s two characters from the disc. These two characters are actually part of the program listing as stored on the disc. If the second one is equal to zero, then there is no more program, and it jumps to Line 999 to finish.

Line 30 gets another two characters, and converts them into the program line number in Line 35. Line 37 then gets the next character and if, after conversion, it is equal to zero, this indicates the end of the current program line, so it jumps back to Line 25.

Lines 40 and 45 are used to check where we are on the screen (`Peak(211)` returns the current screen position) and then if everything is OK it prints the character read from the disc. Line 40 is used for an ordinary character, and Line 45 is used if it's a Basic key-word as contained in the array `AS`. Lines 50 and 55 check again to see where we are on the screen, and to see if the last character printed was a colon or a comma. If so, and it is near the end of a screen line, then — for legibility — it goes to Line 65 to print the line number again and moves back. Line 37 for the next character. Line 60 just sends the program to Line 37 for another character.

Complicated stuff! By reading the previous paragraphs again and hopefully typing in the program and getting it working, you should not only gain a good knowledge of how programs are stored in disc, but should also learn a fair amount about how to manipulate disc information.

Next week we'll start taking a look at the construction of a random access file (and no, we won't be using the program in the Commodore manual!).

FIGURE 1 : SEQUENTIAL FILE DEMO

Cut-price school offer

COMMODORE has finally come up with its answer to the government's 'micros in schools' scheme – a cut-price offer of its own.

Deliberately designed to coincide with the end of the government scheme, Commodore is offering schools and

colleges throughout the U.K. the chance to buy Commodore this complete with 1541 single floppy disc drives, Logo and Simon's Basic for £299.99 per package. This is a saving of £172 over the recommended retail price of £472.

The best books for the BBC Computer

functional forth
for the BBC computer

Functional Forth

Boris Allan develops routines in Acorn soft Forth to demonstrate a) how easy it is to write in Forth and b) that the programs are fast enough to dispense with the need for machine code.

ISBN 0 440 000 00 1

Programming for Education

The book, written by teachers, is aimed at showing younger children how the various features of the BBC Computer can be used to their best advantage.

graphic art
for the BBC computer

Graphic Art

The graphics in this book match the style and sophistication of the BBC computer and its Basic language. Boris Allan shows what can be achieved with Turtle graphics.

ISBN 0 440 000 00 1

DIY Robots and Sensors

Make your own joystick, robot, eye or whatever you like. The book gives you step-by-step instructions on how to construct a wealth of gadgetry for use with your BBC computer (Pub. 28th October).

Look out for the Sunshine range in W.H. Smith's, Boots, John Menzies, other leading retail chains and through our national network of book shops and specialist stores.

DUCKWORTH HOME COMPUTING

All books written by Peter Gerrard, former editor of *Commodore Computing International*, author of two top-selling adventure games for the Commodore 64, or by Kevin Bergin. Both are regular contributors to *Personal Computer News*, *Which Micro?* and *Software Review*.

VIC GAMES by Kevin Bergin

This is a collection of 21 exciting programs specially written for the VIC, including *Gold Snake*, *Alien Attack*, *Dragon*, *Car Dodge*, *Tank Battle*, and *Minefield*. An adventure game is also included as well as a program to enable you to devise your own version of Basic by re-defining keywords. Each program is accompanied by notes on its structure to enable you to modify or extend it. £6.95

EXPLORING ADVENTURES ON THE VIC by Peter Gerrard

The complete guide to computer adventure games, playing, writing and solving them. Starting with an introduction to adventures, and their early history, it takes you gently through the basic programming necessary on the VIC before you can start writing your own games. Inputting of information, room mapping, movement vocabulary and everything required to write an adventure game are explored in full detail. Then follow a number of adventure scenarios, and finally three complete listings, written specially for the VIC. Two of the games listed in this book require 16K expansion and the third requires 32K. The three games are available on one cassette at £1.95.

£6.95

Other titles in the series include *The Beginner's Guide to Computers & Computing*, *Spies & Sound on the VIC*, *Simple Electronic Projects for the VIC*, *Will You Still Love Me When I'm Old*, *Advanced Basic & Machine Code Programming on the VIC*, *Advanced Basic & Machine Code Programming on the 64*, *Exploring Adventures on the 64*, as well as *Pocket Handbooks for the VIC*, *64*, *Dragon*, *Spectrum* and *BBC Model B*.

Open Forum

Open Forum is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £6 for each program published.

Dice Game

on Dragon 32

This is a simple game which involves betting on dice.

Program notes

150 Initialises variable MM — money held
Reseeds the random number generator, using dummy variable MM

160 — 190 Control the action between subroutines
200 Checks that MM is greater than zero, and if not goes to the end of game routine, otherwise loops back to line 170
220 Program end
250 — 310 Introduction subroutine prints game instructions
350 — 410 Get bet subroutine, tells player how much he/she has and asks for money to be bet, and dice total to be bet on

450 — 480 Checks both values are within given ranges
Throw dice subroutine, gives the two dice D(1) & D(2) their values, and then calls the second level subroutine at line 680 to print out these dice
520 — 550 Adjust money subroutine; checks whether player has won or lost and informs player. Then adjusts money, by either adding or subtracting the amount of the bet
590 — 640 Game over subroutine, informs player that the game is over and asks whether the game should be restarted.
680 — 730 Print dice subroutine, this is a second level subroutine called from the subroutine at line 450.
Note: Most, if not all Rem statements can be deleted, the subroutines are numbered after the Rems, and these are included for clarity only.

by Ian Barclay

4 Stroke

on Spectrum

This program is designed to show the

basics of how a four stroke petrol engine works. The program works on a Vic 20 with super expander cartridge. The program draws an engine in high res and then

animates it showing the four strokes: inlet; compression; spark; and exhaust.

The program will continue running until run stop is pressed.

HISOFT PASCAL DEVPAC

Quality ZX SPECTRUM® Software

HISOFT PASCAL 4T

"I haven't seen any other compiler that could match Hisoft's Pascal. Using the Spectrum Micro - Autumn 1983.
This is a very impressive product... of benefit to any Spectrum programmer. David Bolton ZX COMPUTING Aug/Sept 1983

Just two comments from full-length reviews of our powerful and virtually full implementation of Standard Pascal. The advantages of using Pascal are well known - fast, self-documenting, and proven as structured programs and now with Hisoft Pascal you can reap all these benefits on a wide range of home computers. Including the Apple, Sinclair Spectrum, Hisoft Pascal produces programs that run typically 40 times faster than equivalent ZX BASIC programs and sometimes up to 1,000 times faster!

Hisoft Pascal supports FOR...DO WHILE...DO REPEAT...UNTIL CASE OF, INTERFACES, REALS, CHARACTERS, RECORDS, POINTERS, SETS, ARRAYS etc. etc. - it is not a tiny Pascal but a virtually full implementation of the language allowing the user to develop true high level language skills while attaining a solution speed close to that of machine code. Complete with a 70-page manual.

HISOFT DEVPAC 3

DEVPAC is most highly recommended. The documentation is first class. Your Computer May 1983

If you write programs in machine code buy DEVPAC - it is the best currently on the market. Adam Dinning ZX SOFT in Which Micro September 1983

Two comments from reviews of earlier versions of DEVPAC - now we have DEVPAC 3 available: a powerful Z80 assembler with conditional assembly, assembly from tape (to enable generation of very large code files), ORG, EQU, DEFS, DEFW, DEFB, labels of any length - in fact all you need for fast (3,000 lines per minute) and powerful assembly programming. But it doesn't stop there: DEVPAC 3 also includes an incredible debugger-assembler giving you a front panel display of the Z80 system and allowing extensive debugging of your machine code program, including single-stepping programs EVEN IN ROM! Open up the secrets of low-level programming with DEVPAC 3.

Prices:
Hisoft Pascal 4T (ZX SPECTRUM) £25 inclusive
(NewBrain, SHARP MZ700 etc) £35 plus VAT
Hisoft DEVPAC 3 (ZX SPECTRUM) £14 inclusive
(NewBrain £25 inclusive)

STOP PRESS Hisoft Pascal for the SPECTRUM now comes complete with a Little Graphics package allowing fast and easy production of complex graphic displays

by Martin Jayce

Microradio

GW6JJN

Wishful thinking?

A month or so ago I spoke about packet radio, albeit rather briefly, and many of you wanted to know more. The concept of packet radio is new in the sense that transmissions are in binary. Of course it could be said that morse code is a 'binary' transmission and in a sense it is. Because the message is in dots and dashes, morse will succeed where voice fails.

Imagine the advantages of morse but, instead of sending letters of the alphabet, we could send encoded voice and pictures as well as computer programs and data. Not at 12

words per minute but at 2400 bits per second.

Anyone who has seen or used a time shared computer system will know that the computer is incredibly fast and the user extremely slow by comparison. If each user were connected by radio link to a computer, then in order to allow multi-user capability, the computer has only to check each link occasionally and divide processing time between users. For example, it might take you 30 seconds to type in a line of type, but only a few milliseconds for the computer to process that information. It appears to the user that he has the computer all to himself.

Think then of the radio link itself. The line that took you 30 seconds to type might have 64 eight bit ASCII characters, or 512 bits of information — that is an average rate of 512 divided by 30, or about 17 bits per second. It's pretty simple to send 2400 bits per second

through a voice channel. So if we were able to store each piece of information locally and then send it in a short burst, it could be sent in about 0.2 secs or a fifth of a second. This means that, with suitable protocols, several hundred amateurs could be accommodated on the same voice channel, each thinking that he had the channel to himself. The possibilities are enormous; crowded bands would be a thing of the past.

The short burst already mentioned is a packet. It would contain, in addition to the data, identification of sender and receiving station and an error checking system to know that the packet is correct (if not it would be sent again automatically). Instead of a central computer, each station would use a home computer programmed with the protocols and interfaced to the transceiver. If these packets were then sent via a suitably intelligent com-

puter controlled node in a repeater or satellite, then the possibilities are endless and very exciting.

Each node could be set up in the way repeaters are set up, with a group to run it. The facilities it could offer as well as relaying packets are bulletin boards, utility programs to download, or even the possibility of a multi-user adventure game. . . . Now there's an idea to keep you awake at night, rmg-chewing will never be the same again.

Is all this wishful thinking and science fiction? — No, it's packet radio and it's available now.

Ray Berry GW6JJN

A new product from Melbourne House is, like *Sherlock*, "still in preparation", though in a more advanced state, and likely to be with us in the next couple of weeks. It is another book, and one that will be of great interest in particular to many of the readers of the Adventure Corner — and, incidentally, make a large part of my job easier!

David Elkan has written *A Guide to playing The Hobbit*, a book that I never thought Melbourne House would be eager to see the light of day. But, apparently, Fred Milgram, who runs the company, forgot his misgivings when he saw the manuscript. Although the book does indeed present a solution, it by no means gives away the whole game.

To carry on with the subject of new releases, and competitions, Camell Software's next program, *The Wrath of Magra*, is nearing completion, and will be launched with a competition. Camell tell me that £5000 of prizes will be on offer, including 20 (count 'em!) colour TVs, and four or five big computers.

While at the Heathrow trade show a couple of weeks ago I was unexpectedly introduced to Scott Adams. His adventures have just recently, as you'll know, been converted to run on the BBC and Spectrum computers — Adams says that he admires both machines, and intends to write more programs for them. His company, Adventure International, has joined up with Marvel Comics, and bring us adventures featuring many of the favourite heroes, like *Captain Marvel*, the *Hulk*, and *Spiderman*. Apparently, the player will take on the personality of the hero in question, and his attributes.

Says Mike Woodroffe, Adventure International UK's Managing Director: "Marvel will produce a comic to go with each game. The storyline is left at a certain point, and you have to go on the tape to complete the adventure." The programs will all feature high-resolution graphics. The projected release date of the first in the series, *The Hulk*, is May, but only a couple of

pictures were on view at the show, so I think it is a rather optimistic forecast. However, if you are a Spectrum, Atari, Commodore, BBC or Oric owner, and you want to leap buildings at a single bound (or even two), and run up a large clothing bill, you won't mind waiting, will you?

Ian Hislop, deputy editor of *Private Eye*, making foray into the rather more sedate world of *The Listener*, managed to aim a sideswipe at the world of computers in general, and adventures in particular. After describing the computer profession as "men with beards, wearing Camra sweat-shirts and training shoes" — I have been known to grow tired and emotional in the company of the Camra-clad, but I haven't an item in their clothing, although I do, I admit have a fondness for training shoes — he goes on to say "A radio producer once confided in me that he had found it almost impossible to find anyone interesting in the whole industry."

Note: almost impossible — he obviously couldn't bring himself to condemn the whole "industry"; after all, he may one day be after one of the afflicted for a job! But maybe he was talking of the broadcasting industry — have you met an interesting radio producer lately? They are probably the most out-of-touch, out-of-date bunch to be found outside of Fleet Street.

Hislop continues (warming to his subject of adventures): "I always feel Frodo must be the point of contact for the computer world, being small, bearded men who never see the light of day and who toil underground." Ah, we're back to radio producers!

All this witty comment from a man who,

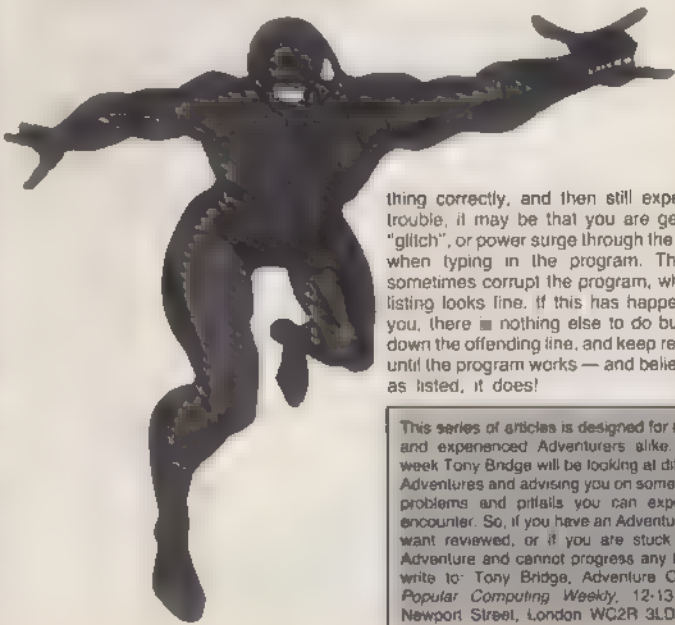

later in his column, goes on to attack those critics (who) so often adopt a contrary pose for effect." Hurriedly he defends his own position: "My computer-phobia is genuine, though it looks like a pose." Excuse me, I think I'd better dive back down my underground cavern and carry on shining my training-shoes — I've just thought of an excellent use for them...

Talking of books (well, I was some time ago!), I've had several letters from people who have read my own modest contribution to the literary world. Many of them, I force myself to say, have had nice things to say about it — Thank you very much! Others, however, have been cries for help in typing in the program. This is representative:

"Would you please send me a list of bugs printed in the first edition of *Spectrum Adventures*. I can't find all of them, and your program still won't run. I have made no mistakes in typing it in, and I've checked and re-checked," P. Wilson, Lancaster.

I have had the same sort of plea from several people — unfortunately, they are stuck in different places, some a lot further on than others. However, many more people have written to say how much they have enjoyed playing the game!

The listing in the book was taken directly from the master tape of our program (which, incidentally, has been the subject of a recent special offer from PCW). So, if you are having trouble with the listing, make absolutely sure that you have typed every comma and semi-colon. The slightest difference may be catastrophic. If you are absolutely sure that you have done every-

thing correctly, and then still experience trouble, it may be that you are getting a "glitch", or power surge through the mains, when typing in the program. This can sometimes corrupt the program, while the listing looks fine. If this has happened to you, there is nothing else to do but track down the offending line, and keep re-typing until the program works — and believe me, as listed, it does!

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further write to: Tony Bridge, Adventure Corner, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Tapes also in stock for:

★ SPECTRUM

★ COMMODORE 64 and VIC 20

Sorry but not for hire.

CALLERS WELCOME

Peek & Poke

JOYSTICK LINK

Eurrie Eajadhar of Balham Park Road, Balham, London writes.

Q I would like to know if there is a joystick available for the RMI Link 480Z?

A As far as I know there is no joystick available for the Link RMI 480Z. I do not have a 48K to hand, however the port is an analogue output. You need something along the lines of a variable resistor with the wiper line wired to each of the joystick pins. This will help you to read the potentiometers that give the analogue outputs. The two push buttons need to be wired to the Ov line and the resistor

GRINDING TO A HALT

C.A. Boyce of Grand Avenue, Lancing, West Sussex, writes.

Q I have a 48K Spectrum for a year but my use of it is grinding to a halt for lack of information. The user manual is pretty awful. In particular I want to find out how to use the port. I wrote to Sinclair but they just answer that there are books about. Can you suggest one book that will give me instructions of how to get at the port.

A I get letters from time to time from Spectrum owners that are less than complementary about the user manual. I see quite a few manuals, and in fact, the Spectrum one is one of the best.

I do agree that information directly relating to the port is quite scarce. However Delving

Deeper into your ZX Spectrum by Dilwyn Jones has several pages of useful information, and routines to demonstrate various aspects of the ports in action.

ANNOYING HABIT

Robert Nunn of Palm Road, Romford, Essex writes.

Q I have just purchased the 'Currah' Micro Speech System and would like to know if there is a cure for a very annoying habit it has. It crashes programs after a minute or two. I also have difficulty in loading games that are compatible, such as *Atic Atac* and *Lunar Jetman*.

A The Currah is an excellent speech unit, but apart from the fact it has no expansion port and is thus a dead end device, it has a second disadvantage in that it cannot automatically be used with any program. This is because the unit needs 256 bytes for its own use. So it lowers Ramtop to give the space. Unfortunately a lot of commercial programs do the same.

This is the source of the problems as both the unit and the program can often end up trying to use the same space. Some programs have been adapted to overcome this, however they must be marked as compatible. Games such as *Atic Atac* were initially written before the advent of the Currah unit, and as such had no provision for it. If you have one of these earlier versions then I am afraid that you will have trouble using them in conjunction with the Speech unit.

SPECTRUM SOUND

David Muir of Ailsa Road, Saltcoats, Ayrshire writes:

Q I have built a programmable sound Generator for my Spectrum. After a few attempts I realised that I did not know how to connect my Spectrum edge connector to the 8 pins 7-14 on the AY-3-8912 sound chip. Can you help — do you know which lines on the

Spectrum edge connector go to these pins?

A I am wondering whether or not you have slightly confused the AY-3-8910 and AY-3-8912. Nevertheless this should not matter as in this case the control is the same as far as pins 7-14 are concerned.

Pins 7-14 are an I/O port and in fact they do not have to be connected directly to the Spectrum, as the computer is buffered via the soundchip. The ports on the chip you will have to find are the Register change port, and the data ports. It is through these that the I/O is controlled.

Whether the port is acting as an Input or Output port depends on bit 6 in register 7. If this bit is 0, then the port will be used for Input. If the bit is one then the port will be used for Output. You control this by Poking the appropriate value into the Register change port. The data that comes to or goes from this port via Register 15. So to output from the port, the data port and register port will have to be set to put the necessary data into this register.

DULL AND LACKING

Robert Dempster of Cockerhill Road, Cockerhill, Glasgow, Scotland writes:

Q Please could you inform me of any established software for the Aquarius — I have found most of the usual software for this computer dull and lacking in the addictive quality common to most Spectrum tapes.

A The vast amount of software available for the Sinclair computers, reflects the success of the machine. Any new computer whose initial sales are not large, cannot expect to attract many software houses to write for it.

I would have to see the

amount of software increasing little in bold quantity, and hopefully quality. One help would be a machine code monitor for the machine to enable people to write machine code more easily.

AN OBVIOUS CHOICE

Stewart Murray of Troon, Ayrshire writes:

Q Is there anyone a version of Fortran for the Spectrum? If so do you know where I can get it and how much it will cost? S. Lawrence of Victoria Road, Newport, Isle of Wight, also asks: I have 48K Spectrum and wish to use PASCAL on it. Are there any programs on the market which will enable me to do this? and finally Mr A Ibrahim of Longsight, Manchester writes: I have recently bought a Forth Compiler for my Spectrum and am very impressed with the speed and compact structure. Do you think that Forth is a good language to write arcade games in. Also do you know the address of the Forth Interest Group.

A While sooner or later I suppose I expect to see everything including a kitchen sink available for the Spectrum, at the moment it is not, and nor is Fortran to my knowledge. In all honesty it isn't an obvious choice for a language on the Spectrum.

Pascal is slightly better served. Hi-Soft do a Pascal compiler for the Spectrum. They can be contacted at 13, Gooseacre, Cheddington, Leighton Buzzard.

As for the Forth Interest Group, well this is a language that has been tipped as being likely to replace Basic, highly debatable but, nevertheless it deserves its success. The Forth Interest Group are to be found at: Bradden Old Rectory, Towcester, Northants. Contact K. Goldie-Morrison.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem Peek it to Ian Beardsmore and every week he will Poke back as many answers as he can. The address is Peek & Poke, PCW, 12-13 Little Newport Street, London WC2R 3LD.

48k

WIN THE POOLS?

SPECTADRAW 2 — THE MOST POPULAR POOLS PREDICTION PROGRAM OF 1983 NOW EVEN BETTER VALUE IN 1984!!!!

- ★ Supplied with a database tape containing data on over 8,000 matches since 1980.
- ★ Database is updated each week by user.
- ★ Match and Division names already in the program — no tedious typing every week!
- ★ Program is menu driven for simplicity in use.
- ★ Errors can easily be corrected — the program even checks your entries!
- ★ Comprehensive instruction manual designed to make the program easy to understand.
- ★ Will also forecast the least likely draws for those who prefer to bet on fixed odds.
- ★ Supplied together with SPECTASORT — the Perm Generation Program which takes SPECTADRAW 2's predictions and turns them into ten from 10 full cover perms. Complete your coupon direct from the screen!

SPECTADRAW is 8,000 MATCH DATABASE, SPECTASORT AND INSTRUCTION MANUAL. THE COMPLETE POOLS PREDICTION PACKAGE FOR THE 48K SPECTRUM — NOW AT THE UNBEATABLE PRICE OF £9.95 INCLUSIVE (Cheques PGs payable to S. McAlloy)

READY FOR THE FLAT SEASON

COURSEWINNER

THE PUNTERS COMPUTER PROGRAM

COURSEWINNER allows you to use the power of your computer to get the edge on the bookmaker. The program contains a database full of detailed information on all English and Scottish flat courses. You can specify horses, jockeys, and effect of the draw to different weights carried and race lengths, and for each course. This information can be displayed on the screen for reference at any time.

COURSEWINNER can be used in two modes — quick mode requires only the starting price and results of the last three outings (as found in any newspaper) for each runner. Extended mode allows detailed analysis of the following factors:

- Recent form and starting price
- Trainer and jockey team for the course
- Weight carried and race length
- Effect of the draw and of the going
- Also included in the package is a utility which calculates the returns on any single or accumulators bet, win or place, for paid and dedicated

Available for SPECTRUM (48K), BBC (16), COMMODORE 64, DRAGON, APPLE II, ATARI (48K)

Price £12.50 all inclusive

POOLSWINNER

THE ULTIMATE POOLS PREDICTION PROGRAM

POOLSWINNER is the most sophisticated pool prediction and even produced. It comes complete with its own massive database.

Fully menu driven. Simpler to use yet very powerful.

Predicts SCOREDRAWS, DRAWS, AWAYS and HOMES.

Since Software guarantee that POOLSWINNER performs significantly better than chance. Your prospects of dividends and perhaps a jackpot are greatly enhanced.

POOLSWINNER can be used to calculate the league table, as the season progresses. The tables for any division can be displayed for reference at any time.

THE DATABASE encompasses the season is the largest available — over 2000 matches (10 years league football). The database automatically updates as results come in, allowing the program to adapt to recent changes in patterns.

POOLSWINNER is for use with English and Scottish league matches in cup matches between league sides. The program can be used for all future seasons.

The package is complete with program, 20000 match database, and detailed instruction booklet.

Available for SPECTRUM (48K), Z801 (16K), BBC (16), COMMODORE 64, DRAGON, APPLE II, ATARI (48K)

Price £15.00 all inclusive

(immediate dispatch (return of post))

Build a robot...

DIY Robotics and Sensors with the BBC computer

by John Billingsley

How do you interface a home-made joystick, a stepper motor or a fully fledged robot to your BBC computer? How do you write the software for stepper motor control and how can you use the software and a few pennyworth of components to get an analogue output? How can you build a cheap eye for robot vision?

Step by step instructions guide you in constructing a wealth of gadgetry. At the same time you will build an understanding of the principles of digital and analogue input and output.

Although he spent eight years as a Cambridge don John Billingsley has a practical approach to engineering. His commercial designs range from auto-pilots and a hospital computer systems to single-chip cooker timers and a rising damp meter.

He is a member of several IEE committees, leads a team researching into robotics and is well known as the organizer of the Euromouse Maze contest.

Look out for the Sunshine range in W.H. Smith's, Boots, John Menzies, other leading retail chains and all good bookshops. Dealer enquiries: 01-437 4343

Please send me ☐ DIY Robotics with the BBC Computer of £6.95 each. I enclose cheque/postal order for £_____ made payable to: Sunshine Books, 12-13 Little Newport Street London WC2R 3LD. Or phone your order through on Access Mastercard 01-437 4343

MONEY MAKER

If I Had a Million is the latest in Phoenix Software's Arcade/Adventure packages where you must do well enough at the first to even be able to start on the second.

This one is actually a departure from their tradition of one machine-code arcade game and one adventure.

In Part 1 the 'action' involves two or more people playing a sort of computer equivalent of monopoly - you have to buy and sell properties and flirt with the stock market.

If you manage to win over £20,000 at this point you will be given the start code for Part 2 which is basically a financial simulation game where you must invest in property and shares. Both games are fun and I thought the financial simulation was one of the best such games I have played.

GOLD MEDAL

Latest in the continuing adventures of the Piman is *Olympimania* in which our hero gets to try his hand at a number of sports.

Actually, with the exception

of swimming, it turns out that the Piman's various approaches to the different sports are surprisingly similar - somehow they are all reduced to running and jumping over obstacles. After each stage the eager Piman is greeted by cheering crowds.

The (very long) anthem on the reverse side is full of meaning as to the true philosophy of the Piman (Martin Luther King seems to be involved).

CITY STREETS

Hewson Consultants had a minor hit with *3D Seiddab Attack* on the Spectrum and so they can hardly be blamed for bringing it out on the Dragon as well.

The game involves patrolling the latticed streets of a city trying to rid it of various kinds of unpleasant alien. The strength of the title lies in the realistic perspectives.

The screen is split into the view from the cockpit showing

the city and a radar scope showing the positions of the various aliens.

Given the poor reputation the Dragon has for graphics this version of the game is surprisingly close to the original - proving once more that poor programs often are the result of bad programming.

FAST RUN

Until recently if you wanted to compile a Commodore 64 program you had to rely on *Petspeed*, which although effective, is pretty expensive.

An alternative comes from C.P. White whose *Basic Compiler 64* offers many of the same features as *Petspeed* but apparently runs faster, and costs £34.50.

Using the program, most Basic programs can be speeded up sixty times - there are a number of small limitations as to when the program can be used.

The thing about the Commodore 64 is that it is easy, using the graphics and sound hardware, to write programs that look professional - it has always been the run time that has let them down. C.P. White is asking for no more than a mention on any commercial program that has used its compiler, which seems reasonable.

Program Compiler 64

Pick of the week

New Generation

used to have a reputation for technically brilliant but not necessarily very playable games. It was as though the energy that went into one element left little spare for the other.

With its latest release *Trashman*, though, both aspects are perfectly balanced. Not only does the game look good but it's very compulsive as well.

The idea of the game is to collect the bins from an everyday suburban street - beautifully illustrated in high-res detail and complete with greenhouses and estate cars (you can imagine everyone inside the houses eating their mussels and drinking their Pina Colodas whilst watching Channel 4).

GARBAGE IN, GARBAGE OUT

The Bin Man must collect the dustbins one by one, taking them to the refuse cart which is slowly moving up the road and then return them to the houses. Doing this without treading on the grass will, more often than not, result in the owner of the house appearing at the door and offering the bin man a tip for various services (some slightly suspect morally).

Tips (financial incentives not rubbish tips) are useful because they prop up the bonus time which is constantly ticking away. Fail to empty the requisite number of bins in time and you are fired. Getting the bins often involves crossing a busy road - shades of *Frogger* as you avoid the traffic. Walking on the grass not only loses you your tip, it also unleashes a ferocious dog that snaps at your heels - if you get bitten

you'll walk with a limp so losing more time.

Later levels have more bins, more traffic and, occasional pubs in which you can drink and gain more points. Drink too much and the binman becomes almost impossible to control lurching from side to side.

Technically the game is superb with smooth scrolling and movement. My only quibble is the slightly juvenile nature of some of the ha ha comments which appear at the bottom of the screen.

Other than that it's wonderful.

CREATIONS

Screenplay is a new company, partly owned by Dave Patterson, ex-partner in Silversoft. Its first release is an *Animator* program for the BBC — soon to be followed by one for the Dragon.

The program is actually a sprite designer, although with a number of additional features. The size and number of sprites you can have are interdependent — with a standard 8 x 8 layout you can have 63.

The sprites can have all 16 logical colours. A collision checking routine is built into the system and full error reports are also provided.

There are essentially two sections to the package. The first enables you to design the shapes and is called *Creator*. The second turns the designs into machine code information that can be loaded into your own programs (Basic or machine code) — the *Compiler*.

The instructions are fairly simple and there is a demo program written in Basic which illustrates the impressive results you can achieve.

SLAKING

Cobra is the first independently released program for the Memotech MTX machine. It is surprising that there haven't been more programs released for this machine — its graphic and sound possibilities are good and I didn't think it had sold that badly either.

It isn't the most original game you'll ever see, in fact it's a version of *Snake* where you move the cobra around the screen eating various kinds of fruit whilst avoiding walls and rocks. Each item you eat makes the cobra longer so the chance of it bashing into something becomes so much the greater.

Not a masterpiece, but an independent MTX software company has to be good news for owners of the machine.

INSTRUCTIVE

100 Programs for the ZX Spectrum costs £10; from this slim evidence we can deduce one major thing — the programs are not going to be very wonderful.

On the other hand, this doesn't mean they will be completely useless. Of the programs featured here a fairly high proportion are either reasonably entertaining or reasonably instructive.

Programs range from games like *Mastermind* and *Tennis*, utilities like *Travel costs* and *Pie chart* to mathematics programs like *Vectors* and *Polynomial multiplication*. A booklet comes with the package and explains the main features of each program. Probably a good buy for the new Spectrum owner just wanting a good idea of the kind of things his or her machine can do.

STUNNING

Blade Alley is a version of the *Buck Rogers* arcade game for the Spectrum. More precisely it's a superb version of the arcade game.

Describing the game is likely to reduce it to the banality of most other programs; you control a fighter — you must avoid and shoot at various different aliens.

That said, the graphics are stunning, using some clever techniques to give the impression of hurtling through space in three dimensions. The spinning and bouncing aliens seem to come from the far distance and grow threateningly as you rush towards them. Like *Zaxxon* your spaceship leaves a shadow on the alien landscape, adding to the illusion.

There are six different screens of action and the game will work with both Kempston joysticks and Currah micro-speech although not, if they think about it, at the same time.

WORD PLAY

With the launch of the Atmos complete with proper keyboard it's likely we'll see a lot more serious software, in

the first instance — since they have access to the technical information — from Tansoft.

Author is a word processor for both the Atmos and the 48K Oric. Although it is one of the first I have seen for the Oric it looks excellent. The main reason for this being not so much the range of facilities and ease of use, as the way it can be readily altered to work with a wide range of popular printers, sending control codes, etc., without any problems.

The manual is full and clear without being excessively complex and the whole package is to be recommended.

DES. RES.

What games there are still being released for the ZX81 are tending to feature high-resolution graphics making them, apart from colour, visually very similar to some of the simpler Spectrum games.

You can now get a program to help you use high-resolution in your own ZX81 games — *Odyssey Computing's High Resolution Graphics* is not the first such package but it is one of the most straightforward to use.

Other than 16K the standard ZX81 is that is required the new high-res commands held in *Rem* statements within standard Basic.

PROGRAM USE

Now that (assuming you are prepared to wait a couple of months for delivery) Microdrives are generally available for the Spectrum you can expect a series of books on the subject.

Making the Most of Your Spectrum Micro Drives is basically a listings book rather than an explanatory book. The basic techniques of using the drives and Interface 1 are explained but not in much greater depth than in the manual.

The book does, however, contain a number of useful programs which both illustrate the workings and make excellent use of the system. Programs include *Diarys* — an English/French translator, a slide show program which loads up a series of screens very quickly, and a filing system.

Each of the programs is explained and a brief analysis of how each works is included. But the real reason to buy this book is to get a number of programs you might actually have a real use for.

Book *Making the most of your Spectrum Micro Drives*

TURNING LOGO

What with Horizon's 'turning turtle' program and other signs of media infatuation, you'd have thought that there would be hundreds of books on Logo around. In fact there are very few and one of these few — *Introducing Logo* — is by our own Boris Allan.

The book attempts to explain just what is (and isn't) so wonderful about Logo at a fairly deep level and, in particular, discusses why it is commonly considered to be an educational tool.

Boris Allan goes on to explain the differences between one implementation of Logo and another and includes some actual program examples showing the differences.

This Week is a new section that covers all the new software coming on to the home micro market each week. All suppliers should send details of their new programs to: This Week, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Ultimate goal

It is a new sort of adventure game — in real time yet — and after many months I'm still a hopeless addict questing for the glorious ultimate goal. At the start of *Interface Adventure* you find yourself not in the conventional cavern or dungeon, but in a dusty office littered with books and typewriters. Instead of the usual source of light, there is a Commodore 64.

Your mission, should you choose to accept it, is to print out your sense-shattering programs and deathless prose in suitable format for computer magazines, thus assuring you of fame and riches if only the editors display a reasonable gullibility. Unfortunately, the powers of Evil have set barriers in your way, and their foul emissaries Creditcardlimit and Bankmanager bar the prime path to the computer-hardware shop. What a challenge!

After an exciting period of searching through the office's 2,304 locations, all filled with junk and old computer magazines, you are lucky enough to discover a magic talisman to aid you. It is a battered TRS-80 "Line Printer VII" left over from days of yore when the world was young, pigs flew everywhere, and a Tandy Model I wasn't a bad machine to own. It is the work of a moment to think "Aha: RS-232!" and command the goblin hordes at Commodore to supply the relevant interface.

The game then hangs up for two months solid, a cleverly realistic touch. Eventually you find yourself in a low tavern being told at length about the heresies of the dread RS-232 cult, of nameless abominations and loathsome, obscene rites like the Sussing-Out Of Parity and the Preparation Of The Special Cable, all so fearful and eldritch that hastily you instruct the Commodore goblins not to bother.

Instead, led on by a hint from that tavern, you

consult a wise old dwarf at the Tandy centre, who swears to you on a stack of ritual floppy discs this high that the printer's TRS-80 parallel interface and the Centronics interface have a deep spiritual oneness. It is the work of mere hours to take a high-speed InterCity dragon to the fairy land of Tottenhamcourtroad, where legends say the streets are paved with Centronics interfaces. In fact they are paved with paving stones, and you wear out several shoes before wrestling the fabled interface from its fearsome Guardians, who inflict severe flesh wounds in the region of your wallet.

Back in the office labyrinth, you triumphantly link up your system and list several programs. You solve the intricate riddle of how to make your Centronics driver routine work with the Forth cartridge picked up on your wanderings, and proudly use bit-mapped graphics to construct the sacred £ sign the printer lacks. There are a few difficulties, like a tendency to omit the first character of every twentieth line or so, and once in a while to stutttttt slightly, but you feel a sense of achievement. Why then is your score so strangely low? Only when you try your Easy Script word processor do you realize that the adventure has hardly begun.

In fear and trembling you load *Easy Script*. You select Centronics output. You type "Testing" and dump this cosmic message to the printer. It prints: "TTTTeeesssstttllinnnnngggg". Let's draw a merciful veil over the next few hours, noting only that the magic words you pronounce do nothing but blister the keyboard and cause birds to fall lifeless from the air.

Again you venture into the intricacies of this fantasy world. The High Priestess of Commodore Software (despite her cult's reputation for obduracy lands far across the sea) is kind, offering runic diagrams of user ports and other things best not named: she opines that the printer or the interface must be to blame. The Tandy gnomes suggest that the computer or the interface must be to blame. Aztec Software, awesome makers of the interface, are mysteriously silent.

The adventure now takes a serendipitous turn, when, despite your three missives cancelling the order and asking for your gold pieces back, the mighty Amulet of RS-232 arrives from Commodore. Filled with hope, you bodge up some connections which seem cabalistically OK, and write words of power into the CBM-64 command and control registers. The printer speaks! It speaks in tongues. It looks like Serbo-Croat. . .

Interface Adventure. You really must try it; it's so addictive. The game of a lifetime.

David Langford

Number two across

Puzzle No 101

Here is a crossword puzzle, in which numbers rather than words have to be fitted into the grid.

Clues: Across — (1) A*B, (3) B, (4) A; Down — (1) B², (2) A².

Given these clues, what are the values of A and B?

Solution to Puzzle No 98

The first step is to determine the number of handshakes when N persons are present.

If there are N delegates present, each person would shake hands N-1 times and thus there would be N(N-1) individual handshakes. But, since each event is 'shared' by two persons this total must be divided by 2 to arrive at the number of actual handshakes: (N(N-1))/2.

```
10 LET N = 100
20 LET H = N*(N-1)/2
30 LET T = H*2
40 LET G = 1+150
50 LET Q = G*(G-1)/2
60 IF Q > T THEN
70   GOTO 80
80 G = G+1
90 GOTO 50
100 N = N+1
110 GOTO 20
```

The program determines the number of handshakes when 100 or more persons are present. This total is doubled and the result is tested to determine if it, too, is in the series of numbers that could be formed by shaking hands in the manner described.

Of all possible results, only one is in the range stated in the question.

The attendances for the two years were 493 and 697 delegates — resulting in 121,278 and 242,556 handshakes, respectively.

Winner of Puzzle No 96

The winner is: Jim Cowie, Seaford Terrace, Portsoy, Banff, who receives £10.

EAR PIMANIACS AND BIGGER POOLS, THE QUALITY OF THIS SECTION OF THE MAGAZINE, LAUGHINGLY LABELLED 'ADVERTISEMENTS' CAN ONLY BE ATTRIBUTED TO THE FACT THAT OLD EVANS IS SLOWLY GOING OFF HIS ROCKER. I SHOULD KNOW THIS, FOR I AM HE. TO ATONE FOR DISLODGING THE BRAINCCELLS OF THE NATION, I AM INTRODUCING COLOUR TO THIS EPISODE!

COLOUR - THIS IS EPISODE!
EPISODE - COLOUR!
HI THERE, EPISODE!
PLEASED TO MEETHER!
LIKEWISE, COLOUR!
I KNOW WE'RE GOING TO GET ALONG FINE!
RIGHT ON...

WE NOW TAKE OUR ROVING SKETCH PAD OVER TO A SWINWILD TEE-SHIRT PROMO
YES! THE NEW SWINWILD T-SHIRT!
YOU CAN GET COAL-DUST ON IT!
YOU CAN SPILL OIL ON IT!! YOU CAN RUN ABOUT ON IT WEARING THOSE SPIKEY RUNNING SHES!!
WE'RE ABOUT TO ACTUALLY GO DOWN A COAL-MINE, WEARING THE NEW SWINWILD T-SHIRTS!

BUT YOU'LL RUIN IT!
LIFT CAGE
OH! WHAT ARE YOU, A BLACKLEG?
NO, I'M A PINK LEG!
AH - NOT EVEN A LITTLE BIT?
YOU SO MUCH AS PUT YOUR HOSE IN THERE, AND WE'LL PICKET!
WELL, WE'RE ON STRIKE, SEE, SO NOBODY GOES DOWN THE MINE...
UGH

WELL, THAT WAS A BIT OF A WASTE OF TIME.
OH WELL, WE GOT PENFOLD'S ROTTEN OLD JOKE IN.
BUT IT'S NO IDLE JIVE ABOUT THE T-SHIRTS! THEY'RE AVAILABLE NOW FROM AUTOMATA - STATE SIZE - ADULT SMALL, MEDIUM OR LARGE - AND SEND \$5 PER SHIRT! (\$4 FOR CERTIFIED BONA AIDE SWINWILD... TOWN NEW, FOLKS!!)
BACK HOME
HOW WENT THE PROMO?
PHEW. ALL I NEED IS TO FLOP OUT IN MY FAVOURITE - EEEK!!
HALLO
WHO - IS THAT LITTLE PERSON?
THAT'S CUTHBERT!

WHAT IS A CUTHBERT AND WHAT IS IT DOING IN MY CHAIR?
AH... HE'S THE MICRODEAL KID, ISN'T HE? LET'S FIND OUT WHAT HE WANTS
I KNOW WHAT HE WANTS!
I CAN HEAR YOU, PIMANIA! YOU'VE GOT PEOPLE WRITING IN, YOU WILL!
NOW, CUTHBERT, WHAT CAN WE DO FOR YOU?
HOW ABOUT A PAPER BAG FOR YOUR HEAD?
I WANT TO BE A PIMANIAC!
HI, BUDDY! CAKE - YOU GET THE FORM, I'LL GET HIS MONEY!

OKAY... YOU'VE COUGHED UP YOUR \$6 FOR A YEAR'S SUBSCRIPTION - YOU'VE GOT YOUR PUCE-ON PINK SWINWILD CERTIFICATE, AND SOON YOU'LL GET THE FIRST ISSUE OF THE PI-MONTHLY PIMANO BAGGIE... AND NOW YOU'VE GOT YOUR SWINWILD T-SHIRT AT THE SPECIAL SWINWILD PRICE OF \$4 - BUT YOU ARE IN FACT HAVING TROUBLE WITH IT, & NOTICE...
ERIK - YES, IT'S STUCK OVER MY EARS...
NO - THERE THEY ARE...
BUT NOW IT'S ON MY EARS ON SOMETHING ELSE!
LET'S HOPE THIS DOESN'T HAPPEN TO OTHER PIMANIACS! LET I HOPE IT DOES!
IF YOU THINK THAT'S SILLY, TOON IN NEXT WEEK FOR THE GREAT UNCLE GROUCHO RESURRENCE

PIMANIA T-SHIRTS \$5 PIMANIAC CLUB \$5 P.A. U.K.
